SEARCH ENGINES: LOOKS SIMILAR YET DIFFERENT!!

by

Naik Ramesh R*

ABSTRACT

Search engines are systems that find relevant information on the World Wide Web using search robots. These are huge indexes that attempt to include each word from every page of the entire www in their databases. Better knowledge of search engines and Meta search engines, could help you zero in on the information you need on the web more easily. This paper illustrates search engines and meta-search engines on the net.
